EDUCATION

Stanford University

Ph.D. in Economics

June 2023 (Expected)

London School of Economics and Political Science

M.Sc. in Econometrics and Mathematical Economics (*Distinction*)

2016 – 2017

B.Sc. in Econometrics and Mathematical Economics (*First-Class Honours*)

2013 – 2016

RESEARCH AND TEACHING FIELDS

Behavioral and experimental economics
Microeconomic theory

WORKING PAPERS

“Emotional Inattention” with Collin B. Raymond

Job Market Paper

We propose a framework where a decision-maker allocates attention across payoff-dimensions which can be different dimensions of consumption, realizations of an unknown state, or time periods. Attention has two features: (1) it is instrumentally valuable by allowing the decision-maker to take actions, and (2) it leads to an emotional response, which is proportional to the attention devoted to a dimension and the associated payoff. The framework provides a unifying explanation for a number of behavioral phenomena. We discuss implications for policy interventions designed to increase overall utility or improve decisions.

“Motivated Mislearning: The Case of Correlation Neglect” with Tony Q. Fan

We design an experiment to study the role of motivated reasoning in correlation neglect. Participants receive potentially redundant signals about an ego-relevant state—their IQ test performance. We elicit their belief that the signals came from the same source (and thus contain redundant information). Participants generally underappreciate the extent to which identical signals are more likely to come from the same source, but the bias is significantly stronger for good (ego-favorable) signals than for bad (ego-unfavorable) signals. This asymmetric effect disappears in a control treatment where the state is ego-irrelevant. These results suggest that individuals may neglect the correlation between desirable signals to sustain motivated beliefs. However, the estimated effect is not quantitatively large enough to generate significant asymmetric updating about own IQ test performance.

“The Role of Referrals in Immobility, Inequality, and Inefficiency in Labor Markets”
with Nicole Immorlica and Matthew O. Jackson

We study the consequences of job markets’ heavy reliance on referrals. Referrals screen candidates and lead to better matches and increased productivity, but disadvantage job-seekers who have few or no connections to employed workers, leading to increased inequality. Coupled with homophily, referrals also lead to immobility: a demographic group’s low current employment rate leads that group to have relatively low future employment as well. We identify conditions under which distributing referrals more evenly across a population not only reduces inequality, but also improves future productivity and economic mobility. We use the model to examine optimal policies, showing that one-time affirmative action policies involve short-run production losses, but lead to long-term improvements in equality, mobility, and productivity due to induced changes in future referrals. We also examine how macroeconomic conditions as well as the possibility of firing workers changes the effects of referrals.

“Interactions across multiple games: cooperation, corruption, and organizational design” with Jonathan B. Bendor, Nicole Immorlica and Matthew O. Jackson

Teams face a variety of strategic situations. It is socially beneficial for teams to cooperate in productive but not in corrupt ones. However, cooperation in one situation may depend on expectations of cooperation in others. We identify when it is that sustaining socially desirable cooperation necessitates undesirable cooperation. We characterize how cooperation is shaped by the absolute and relative payoffs to cooperation across various tasks, as well as the frequency with which people are reshuffled across teams and whether teams can be specialized in the tasks they face.

FORTHCOMING
PAPERS

“Robust contracting under double moral hazard” with Gabriel D. Carroll

Accepted at Theoretical Economics

We study contracting when both principal and agent have to exert noncontractible effort for production to take place. An analyst is uncertain about what actions are available and evaluates a contract by the expected payoffs it guarantees to each party in spite of the surrounding uncertainty. Both parties are risk-neutral; there is no limited liability. Linear contracts, which leave the agent with a constant share of output in exchange for a fixed fee, are optimal. This result holds both in a preliminary version of the model, where the principal only chooses to supply or not supply an input, and in several variants of a more general version, where the principal may have multiple choices of input. The model thus generates nontrivial linear sharing rules without relying on either limited liability or risk aversion.

WORK IN PROGRESS

“The Role of Memory in Beliefs Formation” with Markus M. Mobius, Tanya S. Rosenblat and Pierre-Luc Vautrey

“Red or Blue Pill? A Positive Welfare Analysis” with Gonzalo R. Arrieta

RELEVANT
POSITIONS

Department of Economics, Stanford University 2022
Research Assistant for Muriel Niederle

Department of Economics, Stanford University 2020 – 2021
Research Assistant for Gabriel D. Carroll

Microsoft Research, New England Summers 2018, 2019, 2020
Research Intern for Markus M. Mobius

Centre for Economic Performance, London School of Economics 2015 – 2017
Research Assistant for Thomas Kirchmaier

TEACHING
EXPERIENCE

Department of Economics, Stanford University
Teaching Assistant for B. Douglas Bernheim and Ilya Segal, Econ 202 (Ph.D. Micro I) Fall 2020
